Dear Japan Biobank Team,

Re: Request for ICD code frequency data for Code Consensus platform

I am writing to enquire about aggregated electronic health record (EHR) code frequency data from Japan Biobank, to include in the Code Consensus platform (<https://code-consensus.netlify.app/>), a resource designed to facilitate transparent EHR phenotyping and across biobank and other studies.

Request:

If possible, I would be grateful if you could provide a summary table of EHR code occurrences in your dataset for ICD-9, ICD-10, and CPT codes, with the following structure:

source	code	system	code_count	individual_count
e.g. UKBB	e.g. I500	e.g. ICD10	e.g. 15,000	e.g. 7,400

Where:

- **source:** The biobank source
- **code:** The EHR code
- **system:** The EHR system, e.g. ICD-10, ICD-9
- **code_count:** Total number of occurrences of that code in your dataset
- **individual_count:** Number of unique individuals with that code

Data handling:

In-line with UK Biobank guidance, I suggest that any codes with an individual count < 100 are suppressed, as the data will be publicly available. If your agreements differ from the UK Biobank please do let me know.

Purpose:

The platform aims to help researchers understand code availability and prevalence across biobanks, supporting more consistent phenotype definitions and improving study design.

Please let me know if you have any questions or require further information. I would be happy to discuss the platform and its intended use in more detail.

Thank you for considering this request.

Yours sincerely,

Dr. Nicholas Sunderland
